re: CIS 114 Final Project Proposal 1

This is NOT actually a site, but a CSS editing GUI. It is a tool intended for amateur web developers.

The user will add the script into the <head> of his page. When the page loads, the user will be able to click on anything in the DOM and alter the CSS formatting for the selected element and view the results live. When the user clicks 'done' their DOM will be dissected and all objects stored in a JSON. The JSON can be uploaded/downloaded via AJAX so that the user can 'save' their work.

Obviously, the user is expected to have prior knowledge of HTML and CSS, but this program should allow the user to experiment with various formatting options without having to constantly be opening, tweaking, saving and reloading their browser since alterations will be immediate.

Board games have always been cool!

Despite the massive public awareness of games like [Monopoly](#), it's NOT a terribly good game. In fact, on the list of Top-Ten board games, Monopoly rates 15988! If you're looking for a great modern game, be sure to check out titles like [Terraforming Mars](#) or [Dominion](#). But let's not forget about where these games came from...

Have you ever wondered: "How do people come up with ideas like these for games?" It didn't happen overnight: board games have actually been around
